

# CHILL ANTI VIBRATION / NOISE KIT FOR 3.5" HARD DRIVES

## +90% Noise & Vibration Reduction

This new innovative silent kit for 3.5" hard drives will dramatically remove noise and vibrations from your hard drive. Even the most silent hard drives on the market today has some motor noise and a "rattle" sound when reading/writing. This noise is being amplified when mounted in your case, but can easily be removed with the Chill Innovation CH-KIT.

## Travel Protection Buffer

The kit is equipped with a rubber protection buffer which will protect your hard drive against shocks when traveling with your computer. Shocks are one of the most common causes for 'bad blocks' and data loss. The 'Travel Protection Buffer' is great for LAN-Party people who travels often.

## Strong and efficient Steel Design

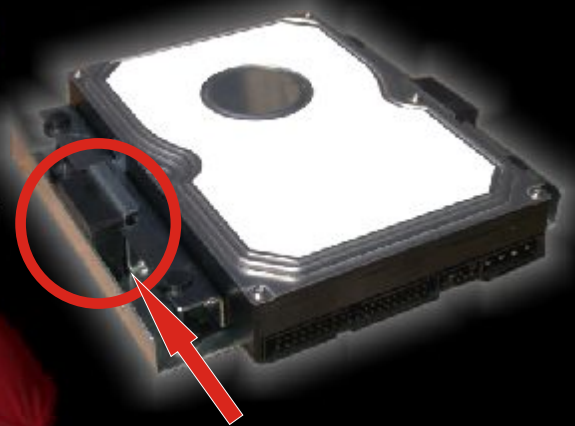

The design is solid, strong and very efficient. Your hard drive will be 100% decoupled from your case using our special rubber system. The entire structure is made so PC case mounting is not related to the de-coupling. This gives a much better HDD stability and better noise reduction.

## Easy Installation for everyone & 60mm fan option

The installation is easy to do for everyone. Everything needed to reduce your hard drive noise is included with this kit. All you have to add is your 3.5" hard drive and then mount the kit in a free 5.25" slot in your PC case. The CH-KIT2 also features an option for a regular 60mm fan for those who want extra cooling for their hard drives.

Model: CH-KIT2
